

①

Madenov 1929: 257 on 3rd pl. pres. Not for Abg - Amz (says basically nothing).

Oldg.
Totomonova p. 92 assumes an meaning of vowels after soft consonants which affect all vowels opposed only by front/back: $b \rightarrow b$, in Old Bg. $b \rightarrow b$, $hR \rightarrow R$ (which she thinks is $aN \rightarrow aN$, and about which she is fucking wrong) $b \rightarrow a$, then Mbg $A \rightarrow R$ ($b \rightarrow R$)

- She thinks b, A, b, R (and $o?$) $> ^{o}A$, which later under other conditions and in different dialects $> o, \hat{o}, a, b, e$.
In Rupszi-Rhodopszi dialect there are examples with just 1 reflex of all these vowels ($u\hat{o}co, u\hat{o}ka, u\hat{o}ena$ type) and so the softness caused by R, A was $\neq$ fully phonologised today.

Other dialects, though, started to unambit $A \rightarrow e$ after so palatal consonants, which wiped out the phonotactic phonemic softness before e .

In EBg. dialects ~~remained~~ ^{remained} cons. remained phonetically soft before $---R, e$, $A(\hat{A}) > 'b$ etc., but of WBg unambit to e caused the preceding cons. to harden.

$\rightarrow$ EBg. (except Rtop + WRupszi) cons. before b softened, but didn't happen in WBg, because softs before e had already hardened (?). EBg. $b > a$ under stress where softness was strongest. The $\hat{e} > a$ after rarely softened cons plus the lack of unambit of $/a/$ after softs (xaxax) is the most important prerequisite for phonemic consonantal softness in EBg and hence in titro 56Bg.

p. 94. the mod Bg PRAPs have non-etymological $-b-$ from the imperfect stem: $zemi'suly < zem-b$, not $zemi'suly$, which is why unstressed the ending is -uly: 66guly

p. 100 "if WBg never developed 2nd phonemic palv., then we'd expect mixing up of $b \rightarrow b$ and $A \rightarrow R$ after LCS palatals, which contradicts Oldg (is this right?). Mbg and WBg dialects". WBg also has less vowels than EBg, but which is odd for a lang with fewer cons." (cf. Slav. vs Ru.)

p. 36-37 Assemanius uses A and H, and not infrequently was ③

HA after LCS plains, which Totomontova sees as signifying phonemic

pal. of the consonant

pg. 35 has examples from Ass. of A/H confusion, but all are after LCS palables
~~and~~ and in endings, which leads. T. to assume "неправильно ca" or
by morphological considerations. ~~De.~~

pg 39. Basically say writing only ZR or WR or XWR or XZWR gives
no information on soft/hardness cuz /č z j/ aren't opposed to plain

versions of themselves, but ZR ZR vs WR XWR (Bolonski kaiti)

prob means C was soft, as soft /č/ / "с" современное современное
"збоку неочувствувана".

'b, 'd 'a etc.

p. 40 Forms from Ruspki - Ruspki Maa. with
reflex of ~~both~~ front nasal
